

Commercial Lending with Platform 2.0: Scope & Requirements

Target: July 31, 2026, | Audience: SAI Group Demo

Objective.

Run a real commercial lending package end to end on the JazzX 2.0 platform primitives. Ingest the YETI loan file, build a governed knowledge representation, spread the financials, apply the YETI credit policy as overlays, grade the result against the analyst-built credit package, and rectify ambiguities through SME-governed feedback. Built on the Canonical Chain, exercised through the JazzX SDK, with the ability to run any model framework (OpenAI, Claude) on top of the JazzX platform.

Demo flow

Stage	Key Requirements	JazzX 2.0 Platform Components
1. Ingest, classify, index incoming loan package	Ingest the full YETI loan file: borrower application and request summary, financials, borrowing base certificate, loan and closing documents, status memo (unclear what exact files a typical input package will have, but we can make some assumptions). Classify each by document type and verify loan package for completeness against specified checklist. Index the loan package for retrieval and “talking to the package” Normalize every document artifact into a Canonical Object so downstream stages see one representation regardless of source format.	Canonical Chain (Evidence primitives) Semantic Reasoning (index and retrieval) Context Management BAF Extension API to write canonical objects These can be our “CL Loan Setup Expert”
2. Extract entities, build ontology and knowledge graph	Extract concepts and entities from each artifact: borrower, facility, collateral, parties, covenants, financial line items, dates. Resolve and de-dup across documents (find conflicting concepts if any). Organize loan package and financial spreading concepts (as a focus area) into a commercial lending ontology representation. Build a knowledge graph for the YETI deal.	Reasoning (entity extraction across artifacts) Knowledge Fabric (dynamic ontology, knowledge graph per runtime object, conflict resolution) Canonical Object schema as the commercial lending domain model
3. Apply credit policy as overlays	Ingest the YETI credit policy and represent it as governed policy knowledge. Apply the policy as written when creating overlay adjustments on the spread; no lending logic hard coded into the platform. Trace every overlay to the policy clause that drove it.	Knowledge Fabric (policy as governed knowledge) Cognitive Mode: Reasoner Trust Governance (overlay to policy clause citation) This will be our “Credit Policy AI Expert”
4. Spread financials, grade vs ground truth	Produce financial spreads from the extracted financials with reported, adjustment, and adjusted columns. Compare against the analyst output in the Yeti Credit Package folder (pointers below). Emit an accuracy scorecard comparing our output with the analyst output.	Cognitive Mode: Reasoner Deep Reasoning (“spreading reasoner”) Cognitive Mode: Evaluator Evaluation Framework (grade vs ground truth, LLM as judge, scoring) Cognitive Mode: Sentinel Trust Governance (citation and trace from each line to source) This will be our “Financial Spreading AI Expert”

Stage	Key Requirements	JazzX 2.0 Platform Components
5. Capture feedback, learn and rectify	Flag ambiguous lines in the generated spread and let the user attach feedback to them. Route feedback through an SME governance workflow for review and approval. On approval, apply the feedback instantly: the ambiguity is rectified and the learning persists for future runs.	Learning and Memory (governed feedback capture and recall) HITL workflow (SME review and approval) Trust Governance (audit trail from feedback to approved change) This will be our “Governed Learning Loop”

Inputs and ground truth

- **Inputs.** SharePoint YETI loan sample folder: application package, financials, borrowing base certificates, loan and closing documents, credit policy, status memo. Formats: PDF, DOCX, and a ZIP of draft loan documents.
- **Spreading ground truth (stage 3).** Grade stage 3 output against the analyst-built spreads in the Yeti Credit Package folder:
 - [YETI Strict Spreads with Appendix \(2\).pdf : primary, reported / adjustment / adjusted columns](#)
 - [YETI Spreads.pdf : supporting detailed spreads, Moody's style](#)
 - [YETI Spreads Appendix Binder.pdf : appendix detail](#)
- **Folder.** [Loan Samples / YETI / Yeti Credit Package](#)
